Butterkoferi cichlid is one of the few African cichlids who does not hail from the African Great Lakes in the Rift Valley. Butterkoferi is a type of tilapia, a group of cichlid popular as a food fish. However, this striped-looking cichlid can make a beautiful fish aquarium in a large enough aquarium. Aquarium SizeThe recommendation for tilapia in the aquarium ranges from a minimum of 40 gallons to 70 gallons. Butterkoferi drop about the mid-range sizes for cichlid tilapia, so consider 50 gallons per fish their minimum. Butterkoferi grow to about a foot in length and are quite territorial, so they need more space than other fish of the same size can. Keep in mind that large aquariums tend to work better for fish, since large aquariums are more forgiving in terms of maintenance, especially for large fish like butterkoferi. Tank MatesS have to carefully pick up tank mates for Butterkoferis. These cichlids get a large and predatory strip, meaning that they will easily make a snack smaller than a fish. On top of this, they have territorial behavior, is not unusual for large cichlids. They can share an aquarium with strong fish such as thorns, soma and other semi-ave-walking West African cichlids of similar size. Several butterkoferi cichlids can share the aquarium, provided that it has at least 50 gallons of aquarium volume for each fish. They are not as aggressive as some large cichlids; Several men can share the tank if you give them enough space. Water ChemistryButterkoferi tilapias are not specific about water chemistry. They come from a wider geographical range than African cichlid lakes, so they have adapted to a wider range of water parameters. They require tropical conditions with water temperatures above 74 degrees Fahrenheit. These fish will thrive in the pH range between 6.0 and 8.0 without any problems. The SetupYou Aquarium should create an aquarium with shelters for your Butterkoferi. Butterkoferi cichlid will eat plants and notorious diggers. This means that you probably need to avoid living plants, even plastic plants may require frequent transplantation. Instead, decorate their aquarium with stones and driftwood. If you store more than one of these tilapias, it becomes even more important to include decorations, since cichlids will use decorations as signs to decide where the territory of one fish ends and the other begins. Keep water above 74 degrees Fahrenheit and pH between 6 and 8 degrees Fahrenheit. Other than that, Butterkoferi is not particularly about water chemistry. PondsFish farmers often keep tilapia outdoors while raising them for food. However, the fish farms that raise tilapia are usually located in the tropics. Cichlids in general do not adapt very well to the cold, and this type is not accepted. Besides Parts of Florida, most of the United States gets too cold for these fish in winter if you have a heated pond. If you have an indoor or heated pond, this may be a better option for your fish than aquarium, as ponds usually have more space than the average aquarium. PICTURES OF THE ACTUAL FISH YOU BUY!!! Altho, if you have a spare big tank they class fish to keep because they have a great personality and ultra aggressive feeders. I saw that one robbed12, but I wouldn't add another one to my tank. Its weird I keep mine with loads of African peacock cichlids and haps I find them fun to watch what they like cat and dog chasing others around the tank, then a little Malawi cichlid will nip one on the fairy tale and he goes chasing smaller fish. Smaller fish have the advantage of hiding in the rocks so butterkoferi can't so much after a few minutes they cook each other, and just come back one on each side of the tank here video from a few weeks ago. Something fishie is going on here Please log in or create an account to join the conversation. Time to create a page: 0.105 seconds Description General: Butterkoferi (Talapia butterkoferi) is an African Talapia that should be stored as a show fish, or paired pair. Because of the aggressive nature of Talapia, it is often difficult to house them with other species of fish. However, the more living space any fish has, the more likely it is to accept other residents. This Talapia naturally occupies the coastal, rocky rivers flowing through Guinea. Butterkoferi will try to recreate the environment to better match Talapia's lifestyle. It is likely that the substrate and decorations in the aquarium will become displaced. It is unlikely that live plants will survive while in Talapia, but can help meet butterkoferi's dietary needs. Butterkoferi will reach an eighteen-inch length, and can be stored as steam. As in the individual, Butterkoferi can be placed in an aquarium of 75 gallons. As a vapor, Butterkoferi must be stored, minimally, in 150 gallons of aquarium. Preferred Water Chemistry: Neutral (6.5-7.5 pH), Intermediate Waterproof (4 x hg) Aquarium Diet (herbivores): Daphnia, Spirulina, herbivorous granules, seaweed and boiled cucumber. Butterkoferi (Talapia butterkoferi) are not strictly herbivores, as far as they are opportunistic. Butterkoferi can also consume krill, Brine Shrimp, Ghost Shrimp, Silverside, and mussels to expand primarily the herbivore diet. Dimorphism: As The Pilotcoferi matures, the male will develop a cranial hump on his forehead to sense dominance. The female will retain the downward shape of the muzzle. The male will develop enlarged dorsal and fins. The female will retain a short, rounded fin shape.
